Overview

B. Legacy Approach - Build Each Cell from Source · https://i2b2.org/docs/b-legacy-approach-build-each-cell-from-source/

Prior to i2b2 1.7.12, it was necessary to build each cell from source. That legacy documentation is included in the subsections here. This approach could still be useful for developers or in unique configurations (e.g., cells are deployed across multiple servers). Note that the properties file configuration details are only used in versions prior to 1.7.12. As of 1.7.12, these properties have been moved to HIVE_CELL_PARAMS in the database.
